HOME-SCREEN DESIGN OPTIONS

Six Directions · Analysis, Inspiration & Recommendation

Each direction is shown next to a reference from leading apps, with in-depth analysis — why it's built this way, pros and cons, and who it fits. At the end of each: links to competitor sites for thorough review.

□ **Concept presentation only — nothing in the app was changed.** Every version shows the same functions (balance/P&L, positions, daily scan, profit engine, signal bot, backtest, exchange, learn) — only arranged and styled differently.

* The "reference" screens are our own stylized renders inspired by those apps (not original screenshots), to illustrate the visual language. Links point to the official sites for independent review.

□ This presentation goes to a **panel of 8 evaluators** ●●●●●●●● — to choose the design direction. At the end there's a **vote: choose between two at a time**, until we reach the winning design.

01

Balance first

The first thing a user checks: "how much do I have / am I up?". Loss-aversion makes them look for it immediately — so it goes on top.

02

Clear primary action

What do I do now? One dominant button above the fold reduces confusion and drives usage (Fitts / Hick).

03

Thumb-reach nav

Bottom tabs = one-hand reachable, a familiar standard — zero learning curve.

04

Hierarchy & less noise

Clear groups, whitespace, and color only where attention is needed — so the eye "flows".

Where We Are Today · vs the Principles

An honest comparison of the current app against product-design fundamentals — what we already meet, and what to improve.

8

✓ Meet

4

△ Partial

2

✗ Gaps

Design principle	Status today	Note
Balance & P&L visible at a glance	✓ Meet	P&L card + live positions on the Home screen.
Standard bottom navigation	✓ Meet	Home · Trading · Learn · Exchange · Account.
Consistent header across screens	✓ Meet	Recently unified into one shared header component.
Visual consistency across all screens	✓ Meet	Dashboard · Chat · Admin redesigned to one language.
Compact screens · less scrolling	✓ Meet	Accordions in menu/admin, condensed hub screens.
Comfortable touch targets (≥44px)	✓ Meet	Fixed, including position-close buttons.
RTL + multi-language	✓ Meet	Full Hebrew and English.
Dark mode + themes	✓ Meet	4 skins × light/dark.
One clear primary action above the fold	△ Partial	Many shortcuts, but no single dominant CTA.
Consistent empty / loading states	△ Partial	Improved (breakouts/demo), not yet uniform everywhere.
Strong visual differentiation / branding	△ Partial	Functional — could be bolder & more memorable (the reason for this deck).
Data clarity (e.g. breakout %)	△ Partial	"Negative but green" is still confusing — known, to fix.
Global search / filter	✗ Gap	No cross-screen search yet.
"Pro" / advanced view mode	✗ Gap	Doesn't exist — proposed as Option 6 (Pro Dashboard).

Bottom line: **the fundamentals are strong** (consistency, navigation, accessibility, languages). The gaps are mainly in **differentiation, clarity and an advanced mode** — exactly where the 6 directions below differ.

Our version

Inspired by competitors

Revolut · fintech

Cash App · simplicity

The thinking — why

This is the pattern proven by leading finance apps. The eye scans top-to-bottom by importance: **balance** → **primary action** → **what's happening now (positions)** → **tools**. The user learns nothing new — the layout is already familiar from their bank and from Revolut, and that familiarity builds trust and lowers support load. The primary action "above the fold" increases use of the core product, and the bottom nav is thumb-reachable on any screen size.

Pros

- Familiar → instant trust
- Zero learning curve
- Accessible to all users

Watch out

- Can feel "generic"
- Less visual differentiation

Best for: **broad adoption & trust** — the safest default.

Key moves

- Dominant balance card up top
- 2 primary actions above the fold
- Concise positions list
- Tools as a secondary icon grid
- 5 standard bottom tabs

2 Simple & Clear

FOR BEGINNERS

Our version

Inspired by competitors

Cash App · minimal

Monzo · clean

The thinking — why

The goal: anyone understands what to do in a second. Distilled to one big number (the balance) and two large actions, with all "noise" removed. Per **Hick's Law** — fewer choices = faster decisions; a light, airy background lowers cognitive load. This is the approach that made Cash App and Monzo accessible to the masses. Excellent for onboarding and for a non-expert audience.

Pros

- Understood in a second
- Great onboarding
- Broad appeal

Watch out

- Too sparse for a power user
- Hides depth/features

Best for: **beginners & a broad audience** — zero confusion.

Key moves

- One huge balance number
- Only 2 large action buttons
- Light background, lots of whitespace
- Everything else one tap away

For thorough review

Our version

Inspired by competitors

Robinhood · brokerage

Bloomberg · pro

The thinking — why

An audience coming from equities expects a certain "language": **portfolio value + a performance chart** up top, then holdings with percentages. A dark, restrained palette and clean typography signal "this is a real financial tool, not a toy". Robinhood made this accessible to a young crowd; Fidelity and Bloomberg keep the professional gravitas. Ideal if we want to position Strateteach as a serious investment platform.

Pros

- Credible & serious
- Familiar to investors
- Data-forward

Watch out

- Can feel "heavy"
- Less friendly to novices

Best for: **serious investors** and a classic-markets feel.

Key moves

- Performance chart under portfolio value
- Watchlist / holdings list
- Measured green/red percentages
- Restrained typography, little color

For thorough review

Our version

Inspired by competitors

Binance · crypto

Bybit · trading

The thinking — why

Crypto traders are used to a certain environment: **a dark canvas, vivid green/red, a live ticker strip and fast access to action.** Darkness reduces eye strain in long sessions, and vivid colors create a real-time, urgent feel. A "Today's breakouts" card up top leverages exactly what makes Strateteach unique. Binance and Bybit built this market language — adopting it makes the app feel native and natural to a trading audience.

Pros

- Feels native to traders
- Real-time energy
- Highlights the breakouts

Watch out

- Intimidating/"busy" for beginners
- Requires familiarity

Best for: **traders & the crypto space** — action-focused.

Key moves

- Dark canvas + neon accent
- Live ticker strip up top
- Prominent breakouts card
- Vivid green/red for P&L

Our version

Inspired by competitors

Monzo · bold blocks

N26 · premium dark

The thinking — why

Here design is part of the brand. **A hero color block for the balance, big numbers, generous spacing and a single primary action** create a premium, "expensive" feel without clutter. Whitespace and bold typography raise perceived value and first impression. Monzo and N26 built strong brands through a bold, memorable visual language. If we want Strateteach to stand out and look "premium" and modern from the first moment — this is the direction.

Pros

- Memorable & distinct
- Premium feel
- Strong first impression

Watch out

- Style over density
- Less info at a glance

Best for: **strong branding & differentiation** — bold and inviting.

Key moves

- Hero color block for the balance
- Big numbers, bold typography
- Generous spacing, few elements
- One dominant primary action

For thorough review

Our version

Inspired by competitors

TradingView · widgets

Binance Pro · dense

The thinking — why

For a power user who wants "everything at a glance": **a widget grid** — **allocation, P&L, positions, breakouts, bot status** — with no scrolling. High information density respects an experienced trader's time, and the layout matches the mental model of TradingView and Binance Pro. Very powerful — but requires familiarity, so it's less suited as a default for beginners and excellent as an optional "**Pro mode**" alongside a simpler version.

Pros

- Max info at a glance
- No scrolling
- Loved by power users

Watch out

- Steep for beginners
- Better as opt-in, not default

Best for: **advanced users** — as an optional "Pro mode".

Key moves

- Dense widget grid
- Key metrics + chart up top
- All data without scrolling
- Ideal as a "Pro mode"

For thorough review

Main Menu — 3 Approaches

The same navigation targets, three ways to present them.

A · Clean list

Simple, flat, everything at a glance.

B · Grouped by category

Accordion: one category open at a time (current version).

C · Icon grid

A visual "springboard", fast tapping.

Exchange Connect — 3 Approaches

The same action (connect existing / open new), three ways.

A · Logo grid

Fast visual pick of the exchange.

B · Cards + 2 buttons

Current version.

C · Guided wizard

Step-by-step for beginners.

Summary Recommendation

There's no single "right" — it depends on the target audience and positioning. We recommend a blended approach:

DEFAULT

Option 1 (Best-Practice)

Safest for most users — familiar, trusted, zero learning curve.

FOR DIFFERENTIATION

Option 5 (Premium)

Looks "expensive" and modern — great for branding and first impression.

ADVANCED MODE

Option 6 (Pro)

Offer as an optional toggle for heavy traders, alongside the default.

Vote · Choose Between Two

Each panelist chooses, at every step, between **two versions only** — the winner advances — until one design remains.

- ☐ **For the panel (8 evaluators):** review the 6 versions above, then here — in each pair, click the version you prefer.
The winner of each pair advances automatically, until a single **winning design**.
On WhatsApp: send your **winning version number** (1–6) in the group, and we'll tally a majority.
